 Other pins include UART0\_TXD, UART0\_RXD, CLK, CE0\_N, CE1\_N, and I2C.

## Problem:

Simulink cannot be applied to Pi.

## Expected reason:

The size of SD card is required to be at least 8GB, but the initial SD card got from the kit is somehow only 3.99GB, which may be caused by some manufacture problems.

## Solutions:

- 1) Get a new SD card with 16GB above.(delivered date: 9<sup>th</sup> Feb)
- 2) Using ethernet cable to directly connect pi to the host computer.(If solution 1 would not work)
- 3) Email Mathwork.( If solution 2 would not work)

EQUIPMENT	<b>Q3: Publish Data from Raspberry Pi Sense HAT to WebSocket Server - MATLAB &amp; Simulink Example - MathWorks United Kingdom</b>
EVENT	<p><b>Question:</b></p> <ol style="list-style-type: none"> <li>How to use <u>temperature controller</u> improve accuracy of pneumotachometer? Searching a cooling method for temperature control (Directly cool down temp or compensate temperature effect-relationship between temperature and airway resistance?)</li> <li>How to use <u>fan or loudspeaker</u> generate signal required? Figuring out Fan law. Making a comparison for fan and loudspeaker when low frequency(5-30Hz) is required.</li> <li>How to <u>send data</u>? Figuring out the Bluetooth protocol of Raspberry pi</li> <li>How to calculate <u>airway resistance</u>? Read more materials.</li> </ol> <p><b>Initial block diagram of system:</b></p> <p>The block diagram illustrates the system architecture. At the top, a 'Mechanical frame' contains a 'Mouthpiece', a 'Pneumotachometer' (represented by a grid of resistors), and a 'Loudspeaker/ Fan'. Sensors for 'TEMPERATURE', 'PRESSURE', and 'FLOW RATE' are connected to an 'IC - PCB Fabricated' section. This section includes an 'ADC' (Analog-to-Digital Converter) and two 'LPF' (Low-Pass Filter) blocks, one preceding the ADC and another after the DAC. A 'DAC' (Digital-to-Analog Converter) is also present. Below the IC section is a 'Micro-control system - Raspberry Pi 3B+' which contains a 'Controller' (with inputs P and F), a 'Processor', and a 'Sensor' (with input T). The Controller provides feedback to the Processor. The Processor outputs 'AIRWAY RESISTANCE RE(Z), IM(Z)' to a 'TCP/IP' block, which then sends 'DATA OUTPUT' to a 'Receiver'. The Sensor also provides input to the Processor.</p>

<b>EQUIPMENT</b>	<b>Paper:</b> <i>Journal of Advances in Biomedical Engineering and Technology</i> , 2016, 3, 14-20 <b>Website:</b> <a href="#">3D Printed Linear Voice Coil Actuator (Open Source) - Bing video</a>
<b>EVENT</b> <input type="checkbox"/> <i>Reading materials</i> <input type="checkbox"/> <i>Laboratory</i> <input type="checkbox"/> <i>Design</i> <input type="checkbox"/> <i>Others (Device test)</i>	<b>Paper:</b> To overcome this problem, Dubois and his colleagues in 1956 first introduced the forced oscillation technique (FOT) as an alternative method for measuring respiratory resistance, which does not require active cooperation of the test subject ( <b>Check this paper later:</b> Scott B, Jonathan P, Burton L, et al. Impulse oscilometry: interpretation and practical applications. <i>J Chest</i> 2014;146(3): 841-847.)  VCA(Voice coil actuator)- expensive but accurate compared to solenoid.  DSP- Simulink supported with DSP system toolbox(Check tutorial on: <a href="#">Get Started with Audio Signal Processing Using Raspberry Pi - MATLAB &amp; Simulink Example - MathWorks United Kingdom</a> )

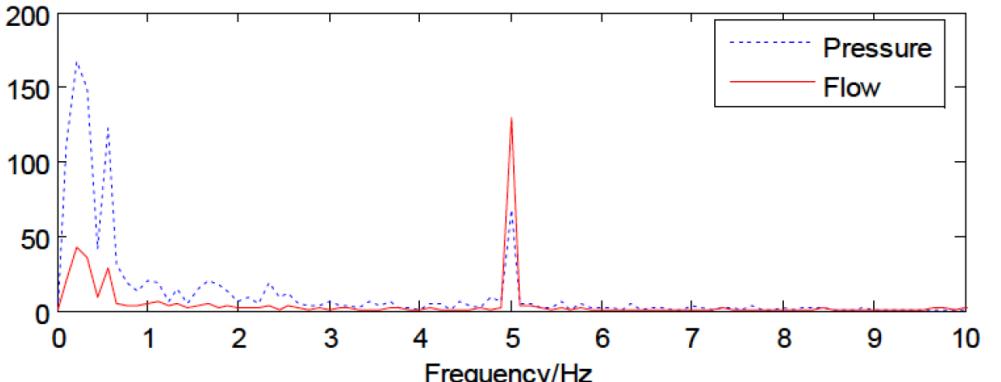

The spectrum waveform of flow and pressure signals before digital filtering:

Power-spectra

Pressure

Flow

Frequency/Hz

Pressure

Flow

All the effective components relevant to respiratory system impedance estimation are below 20Hz, LPF needs to filter out high-frequency and power-line noise interference.

Airway resistance calculation:

The respiratory system impedance is then expressed in the form of respiratory system resistance ( $R_{rs}$ ) and reactance ( $X_{rs}$ ) as :

$$|Z_{rs}| = \sqrt{R_{rs}^2 + X_{rs}^2} \quad (10)$$

$$\varphi_{rs} = \tan^{-1} \frac{X_{rs}}{R_{rs}} \quad (11)$$

Therefore,

$$R_{rs} = Z \cos \varphi \quad (12)$$

$R_{rs}$ - viscous resistance of the airways and the lung tissues

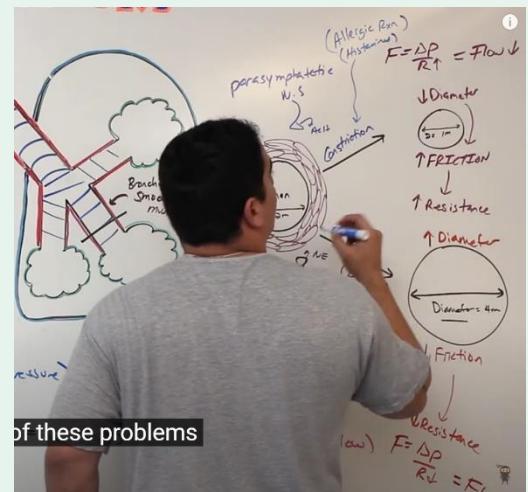

$X_{rs}$ -the elastic and inertial resistance of the airways and the lung tissues.

(Check some medical materials and figure out how doctor diagnose with airway resistance)

EQUIPMENT	Notability, photoshop
EVENT	Initial block diagram:
<input type="checkbox"/> <i>Reading materials</i> <input type="checkbox"/> <i>Laboratory</i> <input checked="" type="checkbox"/> <i>Design</i> <input type="checkbox"/> <i>Others (Device test)</i>	<p>Initial block diagram:</p>
	2 <sup>nd</sup> Block Diagram:
	<p>2<sup>nd</sup> Block Diagram:</p>

**Modification:**

1. Use linear solenoid actuator and a circular membrane to generate AC.
2. Shape of signal generator is changed.
3. DAC and LPF then are cancelled out as solenoid needs DC 6-12v(prefer 6v).
4. Add heating cables incorporated with the temperature sensor.

Temperature difference could be diminished between inside and outside of the tube to prevent vapour condensing on sensors that results in inaccuracy of pneumotachometer.

5. Add multiple TCP/IP.

As the operation voltage of heating cables is 220v(high voltage), which may cause critical risks if heating cables are directly connected with IC and microprocessor. Therefore, remote control is attempted. IP address of a Smart plug connected by WIFI can be obtained so that TCP/IP protocol of raspberry pi is executed for remoting control of this high voltage.

6. Add LCD display, LCD1602+ I2C interface is chosen.

**Question:**

1. How to use LSA and membrane to generate a sinusoidal AC?
2. Can microprocessor provide power supply for signal generator?(with op-amp)
3. How to integrate power supply for whole system?

**Cost updated:**

(To be continued)

EVENT	<p>Reference of airway impedance in different species:</p>

Set 2 approaches to compute resistance and reactance, but cannot get proper result:

```
function [R,X] = A2_Coherence(P,V)
    %L= length(P);

    Cpv=cpsd(P,V,hamming(100),80,100);
    Pvv = pwelch(V,hamming(100),80,100);
    Z=Cpv/Pvv;
    R=real(Z);
    X=imag(Z);
```

Problems:

1. Length of input signal is always 1.(Should set discrete sinewave signal here? What is the sample per frame?)
2. Reactance is always 0 (almost)

Would try:

Update settings of input signals.

1. Read windows/ periodograms.
2. Read principle of Airway resistance again.
3. Use Matlab coding to verify whether whole logic is correct instead of Simulink.

EQUIPMENT	Paper: <b>Rajagiri A, Diona B:Evaluation of Augmented RIC Model of Child Respiratory Impedance Based on Impulse Oscillometry Data Proceedings of the IEEE Region 5 Technical Conference, San Antonio, Texas2006, 291-295</b>
EVENT	<p>1. Respiratory system:</p> <p>Fig.1. Normal respiration signal [1]</p> <p>(Respiratory Signal Processing and Monito.pdf)</p> <p>It is reasonable to use sinewave to represent respiratory signals when running the simulation.</p> <p>Reactance happens because of phase difference between pressure(P) and flow rate(V).</p> <p>2. Electrical mode of respiratory system</p>

Comparison for different RIC models		
Model	Diagram	Notes
Basic model	$Z = R + j \left( \omega I - \frac{1}{\omega C} \right)$	For the RIC model, estimation of R was a one dimensional linear LS(least squares) optimization problem while two dimensional linear LS optimization was used to determine the I and C values
Extend model	$Z = R_p + \frac{R_p}{1 + (\omega R_p C)^2} + j \left( \omega I - \frac{\omega R_p^2 C}{1 + (\omega R_p C)^2} \right)$	Rp: the additional peripheral resistance associated with the compliance allows for the frequency dependence observed of typical real impedance data, nonlinear LS algorithm
DuBois model	$Z = R_{\text{ao}} + j \omega I_{\text{ao}}$ $+ \frac{R_c C_c^2 \omega^2}{[C_c C_t I_t] \omega^3 + [C_c C_t R_t^2 - 2I_t(C_c + C_t)]} \omega^2 + (C_p + C_t) \omega^2$ $- j \omega [C_c C_t I_t \omega^2 - C_p (2C_c I_t + C_t - C_p C_t R_t^2) \omega^2 + (C_p + C_t) \omega^2]$ $- \frac{(C_p C_t) \omega^4 + [C_p C_t C_t R_t^2 - 2I_t(C_p + C_t)] \omega^4 + (C_p + C_t) \omega^4}{(C_p C_t) \omega^4 + [C_p C_t C_t R_t^2 - 2I_t(C_p + C_t)] \omega^4 + (C_p + C_t) \omega^4}$	Airway and tissue resistance (Raw, Rt) Airway and tissue inertance (law, It) Tissue and alveolar compliance (Ct, Cg) nonlinear LS algorithm
Mead model		nonlinear LS algorithm

Augmented RIC model

nonlinear LS algorithm

Ce (see Fig. 5) is intended to model **extra thoracic compliance**, which is thought to increase the real part of the respiratory system's impedance at the higher frequencies due to upper airways shunt effects, as observed in a significant proportion of the IOS data under analysis

Estimation errors:

it is seen that the augmented RIC model provides the best fit, followed closely by Mead's model, while the RIC model provides the worst fit

Conclusion:

the DuBois model yielded the least estimation errors for the given data sets of normal children and children with asthma. But they are also unrealistic compared to the augmented RIC models.

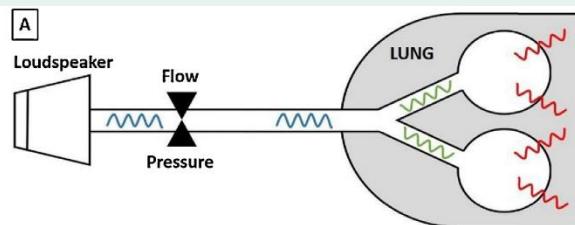

*the augmented RIC model's parameter estimates were more in line with what's expected in these patients and normal subjects.*

Augmented RIC model is chosen for computing algorithms.

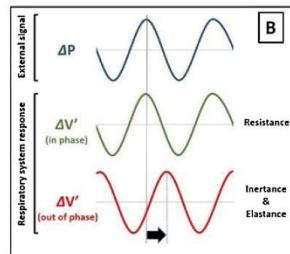

3. Calculate the impedance of a circuit (Fourier transform)  
FFT...(Check syntax)  
Fourier transform at specific frequency (5-30Hz)

Why there would be a difference between different RIC models?

Specific frequency?

NAME	DATE
Peggy Pei	17/3/2022

<b>EQUIPMENT</b>	<p><b>Paper:</b>  <b>Oscillation mechanics of the respiratory system: Applications to lung disease.</b> Kaczka, David W. Dellacá, Raffaele L.</p>
<b>EVENT</b>	<p>FOT advantages:</p> <ol style="list-style-type: none"> <li>1. Impedance data, especially when interpreted with models unique to specific physiologic mechanisms and/or pathologic alterations, do provide very unique insight into structure-function relationships;</li> <li>2. FOT approaches require minimal subject cooperation, a considerable advantage when dealing with pediatric or critically-ill patients.</li> </ol> <p>Z is expressed with a magnitude, to account for relative differences in the amplitudes between the sinusoidal pressures and flows, as well as a phase angle, to account for time shifts (i.e., leads or lags) between them.</p> <p>where <math>j</math> is the unit imaginary number, defined as <math>\sqrt{-1}</math>. For the respiratory system, resistance arises from the viscous flow of gas through the airways<sup>35</sup>, as well as energy losses associated with the deformation of the parenchyma<sup>36</sup> and chest wall<sup>37</sup>. For frequencies below 10 Hz, reactance is comprised of an inertial component (<math>I</math>) due to acceleration of gas in the central airways, as well as an elastic component (<math>E</math>) due to the recoil of the parenchyma and chest wall:</p> $X(\omega) = \omega I - \frac{E}{\omega} \quad (3)$
<input type="checkbox"/> <i>Reading materials</i>	Resonance frequency: impedance would be due solely for resistive losses.
<input type="checkbox"/> <i>Laboratory</i>	For low frequency:
<input type="checkbox"/> <i>Design</i>	At $\omega_0$ , the magnitude of impedance will be at a minimum. Over low frequencies (i.e., $\omega \ll \omega_0$ ), inertia will have a negligible contribution to impedance, and the reactance will be determined largely by the recoil of the parenchymal or respiratory tissues. In this situation, it is common practice to express reactance as elastance as a function of frequency <sup>38-40</sup> :
<input type="checkbox"/> <i>Others (Device test)</i>	$E(\omega) = -\omega X(\omega) \quad (5)$
	If $P_{ao}$ is measured relative to the pressure at the pleural surface ( $P_{pl}$ , often approximated using an esophageal balloon in the living subject)( <a href="#">Use of esophageal balloon pressure-volume curve analysis to determine esophageal wall elastance and calibrate raw esophageal pressure: a bench experiment and clinical study (nih.gov)</a> )
	$(P_{ao} - P_{pl})/V$ is the input impedance of the lungs alone ( $Z_L$ ).
	For frequencies within the commonly used 4-32 Hz band width, this can usually be accomplished with a loudspeaker system with appropriate dynamic response <sup>3449</sup> , which may be placed in parallel with a mechanical ventilator or other respiratory assist devices <sup>50-53</sup> .

More recently, low frequency pressure waveform have been generated with considerable fidelity using [a proportional solenoid valve incorporated into a closed-loop system](#), as this allows for fine control of both mean and oscillatory components of airway pressure.[12/40/56](#)

However in awake subjects, such low frequency measurements require considerable training and cooperation to allow complete relaxation of the diaphragm and chest wall muscles[383957](#).

Pressure Measurement:

which may be obtained at the airway opening<sup>38</sup>, around the body surface<sup>31</sup>, within the esophagus<sup>62</sup>, or even within the airways or alveoli<sup>63-65</sup>.

Be transduced relative to atmosphere by differential sensors.

reluctance transducers/ piezoresistive transducers

Flow measurement:

### Pneumotachographs;

of the mesh screen or capillary tube type (Fleisch) variety<sup>68</sup>.

All pneumotachographs have unique dynamic responses that will systematically distort the measured magnitude and phase of any oscillatory flow, depending on frequency [72](#).

pneumotachographs may require correction for transducer asymmetry and finite common-mode rejection ratio[76](#).

Signal processing:

1. Directly FFT computing

Obviously this method becomes quite time consuming, depending on the desired frequency resolution and range, and is impractical for serial impedance measurements to assess the temporal dynamics of a pharmacologic agonist<sup>84</sup>.

2. Auto/Cross-power spectrum

$$Z(\omega) = \frac{G_{P\dot{V}}(\omega)}{G_{\dot{V}\dot{V}}(\omega)}$$

$$\gamma^2(\omega) = \frac{|G_{P\dot{V}}^2(\omega)|}{G_{\dot{V}\dot{V}}(\omega) G_{P\dot{V}}(\omega)}$$

The advantage of this periodogram approach is that it readily yields the so-called coherence function ( $\gamma^2$ ) between flow and pressure at each frequency.

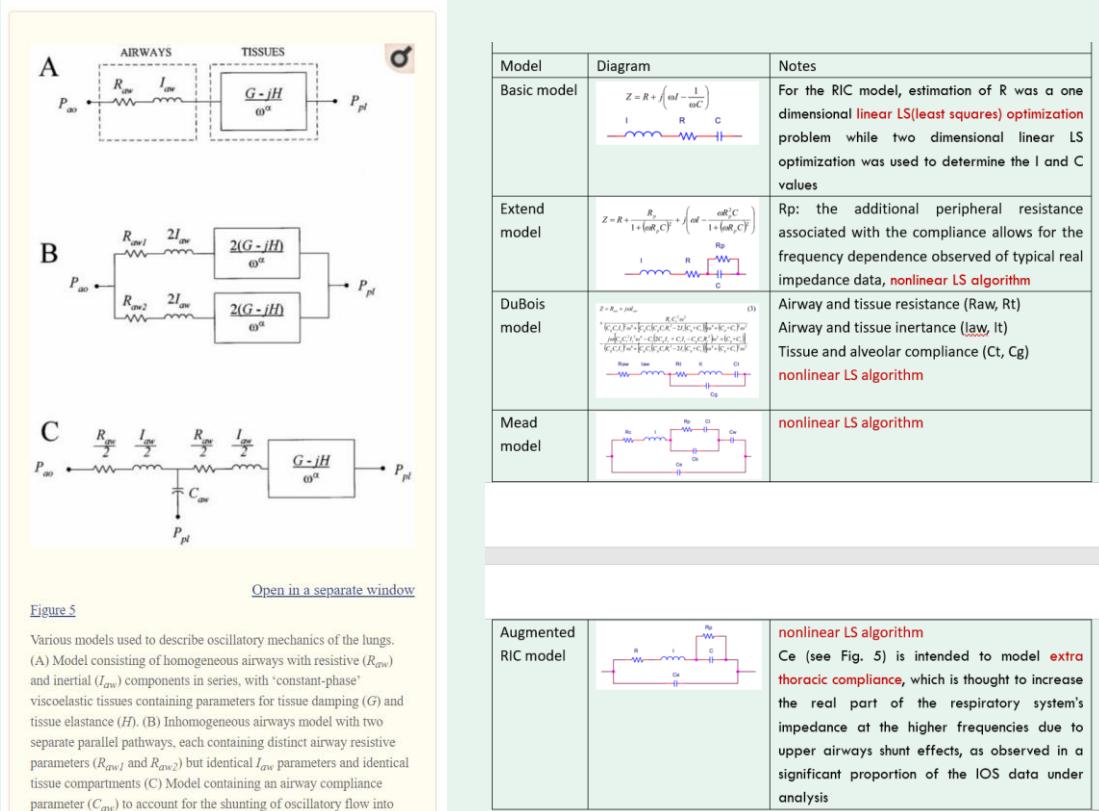

For the purposes of assessing the quality of impedance data, [coherence values](#) less than 0.95 are usually discarded<sup>3839</sup>. Nonlinearities in the respiratory system may result in a distorted estimate of Z or  $\gamma$  <sup>28889</sup>.

3. Optimal Ventilator Waveform (OVW)

More practical and efficient method for measuring low frequency input impedance in humans.

In this case the impedance can be obtained from algorithms based on cross-correlation<sup>9697</sup>, Fast Fourier Transforms<sup>5398</sup>, or various recursive and non-recursive least square techniques<sup>478799-102</sup>

### Inverse modelling of impedance

Otherwise, 5 models collected before would be analysed.

### COPD:

Chronic obstructive pulmonary disease (COPD) refers to either **chronic bronchitis**, **emphysema**, or a combination of the two.

**Chronic bronchitis:** Chronic productive cough without a discernible cause for more than half the time over a period of two years.

**Emphysema** is an anatomic diagnosis, characterized by a pathological enlargement of air spaces distal to terminal bronchioles and progressive destruction of the alveolar walls. The reduction in activity of elastase inhibitors, resulting in destruction and disorganization of elastin fibers in the lung.

### Impedance Measurement:

According to trace of phase change, compliance dominants at frequency from 5Hz to 9.96Hz, whereas inertance dominants at frequency from 9.96Hz to 30Hz. Resonant frequency is 9.96Hz in this case.

### 3.1 OCS: Output Curve Selection Input

Config.	Polarity	Description	Conversion to physical values AOut[V], VDD[V], Differential Pressure (DP) [Pa]	
Linear	Low (GND)	Analog output is configured as a linear output. The sensor is not fully bi-directional in this configuration: -10% full-scale to 100% full scale.	500Pa	$DP = \frac{750 \cdot AOut}{VDD} - 150$
			125Pa	$DP = \frac{190 \cdot AOut}{VDD} - 38$
Square Root	High (VDD)	Analog output is a fully bi-directional output with square root conversion. The benefits are that the bidirectional output has a more stable zero point and higher sensitivity at lower pressures	500Pa	$DP = sign\left(\frac{AOut}{VDD} - 0.5\right) \cdot \left(\frac{AOut}{VDD \cdot 0.4} - 1.25\right)^2 \cdot 525$
			125Pa	$DP = sign\left(\frac{AOut}{VDD} - 0.5\right) \cdot \left(\frac{AOut}{VDD \cdot 0.4} - 1.25\right)^2 \cdot 133$

EVENT	Week 2 summary	
<input type="checkbox"/> <i>Reading materials</i> <input checked="" type="checkbox"/> <i>Laboratory</i> <input type="checkbox"/> <i>Design</i> <input checked="" type="checkbox"/> <i>Others (Device test)</i>	<p>1. Power system:</p> <ul style="list-style-type: none"> <li>-Change PD protocol from a nominal 9V charger (existing).</li> <li>-Add boost converter circuit(9V-12V)</li> </ul> 	
	<p><b>Figure 50. Boost Regulator</b></p> <p><a href="#">LM2585S-12/NOPB</a></p> <p>Found an existing 12V switching adaptor! No booster needed!</p> <p>2. Changed MCU  {why:  1. FFT of HAL-Library for STM32 only available at F4,F7 series.  2. Add UI, take place of pushbutton, easy to manipulate and display data(BLE module may become peripheral).  }  - Multi-tasking control needs <a href="#">RTOS</a> (Luckily, STM32 can do)  - Touch screen as user interface controls start, display numerical results and plots(desired). More programming is required.</p> <p><a href="#">STM32F429I-DISC1</a></p> 	
	Software: STM32CUBIDE+TouchGFX	

### Week3 Plan:

#### 1. Programming:

[Return value on serial monitor](#)

[ADC modules of STM32F4](#)

-Sensor data capture (Differential sensors & STM32-L433RC-P)

-Data storage(RAW? DMA?)

-Respiratory impedance computation (MATLAB .c file from last semester)

-FFT in HAL.lib of F4 series: [Tutorial 1](#) [Tutorial 2](#) [GITHUB code](#)

-Get familiar with TouchGFX UI design

#### 2. Electronics schematics + simulation

{

~~ADP7142(3.3v regulator) (finished both)~~

~~New boost converter (Finished schematics) 12v charger available, no booster needed.~~

~~Load switch circuit (Finished none)~~

}

#### 3. Hardware test (linear solenoid actuator)

Get on WED, test natural frequency

### TODO Today:

~~Load switch circuit (schematics, check SPICE model)~~

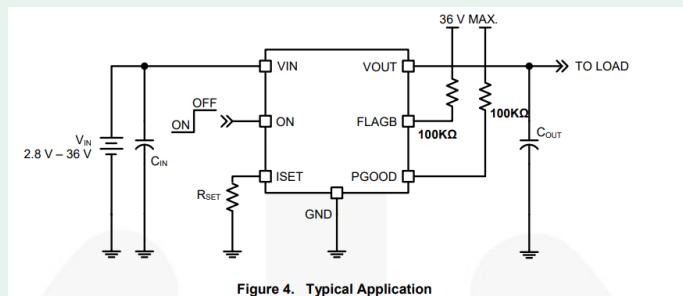

Figure 4. Typical Application

Vin=12V

ON: MCU, active low

V <sub>IH</sub>	ON Input Logic HIGH Voltage	V <sub>IN</sub> =2.8 to 36 V	2.0		V
V <sub>IL</sub>	ON Input Logic LOW Voltage	V <sub>IN</sub> =2.8 to 36 V		0.8	V

I\_limit, R\_set

Table 1. R<sub>SET</sub> Selection Guide

R <sub>SET</sub> (kΩ)	Current Limit [A]			Tol. (%)
	Min.	Typ.	Max.	
111	2.00	2.50	3.00	20
124	1.79	2.24	2.69	20
147	1.51	1.89	2.27	20
182	1.22	1.52	1.83	20
220	1.01	1.26	1.51	20
274	0.81	1.01	1.22	20
374	0.59	0.74	0.89	20
549	0.40	0.51	0.61	20

C\_in=10uF, C\_out=0.1uF

Spice model isn't available, wire on breadboard.

- Programming; serial monitor/ impedance calculation

~~Tidy up all parts on bench~~

Analogue value converted:

1. invalid operands to binary / (have 'uint16\_t \*' {aka 'short unsigned int \*} and 'int'

 `integer` is a **pointer** to `int` (`int*`), so when you want to use the `int` it points to, you need to dereference it:

14

 `int digit1=(*integer)/10000; // and so on...`

for storage memory, in devices such as SD cards, USB drives and SSDs, RAM is used often for calculation.

STM32F429zi **VS** STM32L433rc:

- Memories

- Up to 2 MB of Flash memory organized into two banks allowing read-while-write
- Up to 256+4 KB of SRAM including 64-KB of CCM (core coupled memory) data RAM
- Flexible external memory controller with up to 32-bit data bus: SRAM, PSRAM, SDRAM/LPSDR SDRAM, Compact Flash/NOR/NAND memories

- Memories

- Up to 256 KB single bank Flash, proprietary code readout protection
- 64 KB of SRAM including 16 KB with hardware parity check
- Quad SPI memory interface

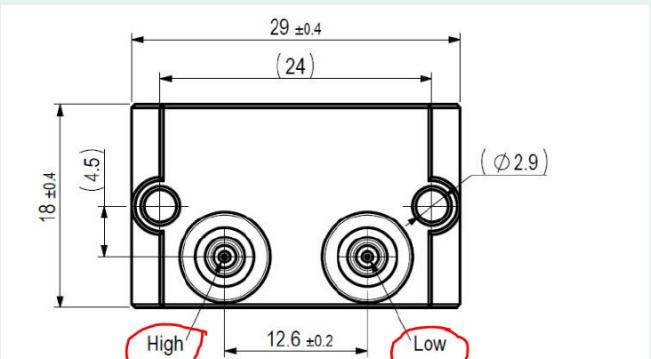

DMA: access to ram, not flash. Flash write causes CPU.

EVENT	<p>Send out frequency sweeping (5Hz to 30Hz)</p> <p>The PWM period (<math>1/F_{PWM}</math>) is defined by the following parameters: ARR value, the Prescaler value, and the internal clock itself which drives the timer module <math>F_{CLK}</math>. The formula down below is to be used for calculating the FPWM for the output. You can set the clock you're using, the Prescaler, and solve for the ARR value in order to control the FPWM and get what you want.</p> $F_{PWM} = \frac{F_{CLK}}{(ARR + 1) \times (PSC + 1)}$ <p><a href="#">Ref above</a></p> <p>In other situations, you'll need to adjust the ARR value. Therefore, you'll need to know the relationship between it and the PWM resolution. This is not a new formula, it's derived from the first one and the <math>F_{PWM}</math> equation that you've seen earlier in this tutorial. We'll need it in later tutorials for designing our Motor driver library and some other applications.</p> $Resolution_{PWM}[Bits] = \frac{\log(ARR + 1)}{\log(2)}$
<p>ARR affects the resolution of pwm signal, maybe PSC should be the factor altered to do the frequency sweeping.</p>

2

```

Sampling time formula in STM32F429([Reference manual rm0090](#))

## 13.5 Channel-wise programmable sampling time

The ADC samples the input voltage for a number of ADCCLK cycles that can be modified using the SMP[2:0] bits in the ADC\_SMPR1 and ADC\_SMPR2 registers. Each channel can be sampled with a different sampling time.

The total conversion time is calculated as follows:

$$T_{conv} = \text{Sampling time} + 12 \text{ cycles}$$

Example:

With ADCCLK = 30 MHz and sampling time = 3 cycles:

$$T_{conv} = 3 + 12 = 15 \text{ cycles} = 0.5 \mu\text{s with APB2 at 60 MHz}$$

Result:

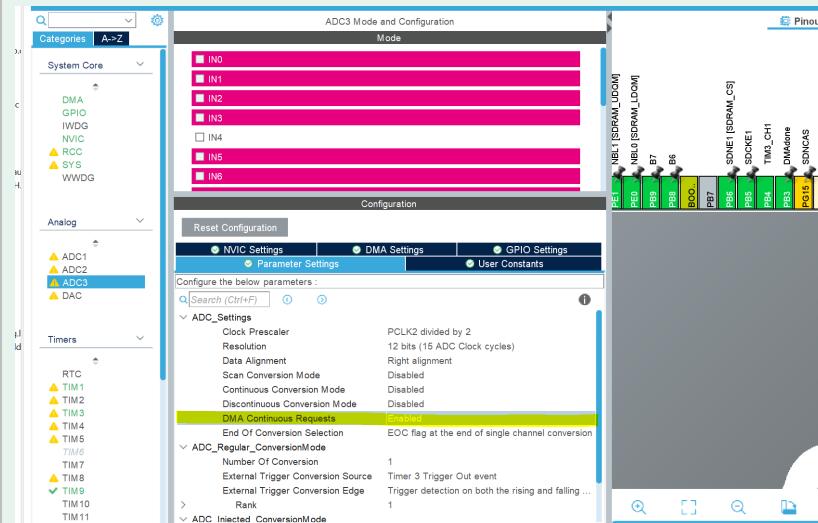

Configuration: F\_s=4kHz, DMA bufferlength =8000;

Use external clock to define specific ADC sample rate.

[TIM3, PB4]

Use external GPIO\_OUT to check the buffer state(interrupt of ADC callback).

Carefully follow this [tutorial setting](#), note one error in this video is that **DMA continuous requests has to be enabled**.

Finally, DMA buffer(8000) is filled within 2 secs as what I want.

TMR:

1. Verify the value for frequency sweeping.
2. How to operate RTOS task
3. FFT in F4

<input type="checkbox"/> <i>Reading materials</i> <input type="checkbox"/> <i>Laboratory</i> <input type="checkbox"/> <i>Design</i> <input type="checkbox"/> <i>Others (Device test)</i>	<p>1. FreeRTOS synchronisation issue.</p> <p>2. Integrated FreeRTOS with TouchGFX.</p> <hr/> <p>- FreeRTOS synchronisation:</p> <p>Why:  <b>osDelay()</b> brings synchronization between different tasks. In this case, I am aiming to read NewBuffState(meaning that adc buffer[4096] has been filled) as a statement to control whether frequency sweeping should be called.  However, sharing a global variable will mess up between different tasks. Changing the priority of tasks doesn't update this same variable at the same time. After research, <b>Queues (xQueueCreate, xQueueReceive, xQueueSend)</b> can be the most efficient way to update/ send/ receive data between different tasks under FREERTOS.</p> <p>Useful links:</p> <p>Q&amp;A: <a href="#">c - freeRTOS: How to pass data between tasks? - Stack Overflow</a>  Tutorial: <a href="#">FreeRTOS on STM32 v2 - 13h Passing items over queue - LIVE lab - Bing video</a></p> <p><b>Problem solved!</b></p> <p>New Code:</p> <pre> /* USER CODE END Reader_StartAccuatting */ void StartAccuatting(void const * argument) {     /* USER CODE BEGIN StartAccuatting */      //-----Frequency Sweeping function-----     HAL_TIM_PWM_Start( &amp;htim4, TIM_CHANNEL_1 );     HAL_TIM_OC_Start(&amp;htim4, TIM_CHANNEL_1);     htim4.Instance-&gt;ARR=720000;     htim4.Instance-&gt;CCR1=htim4.Instance-&gt;ARR * 0.50;      /*Get ADC state from task1.     osEvent_retrvalue;      /* Infinite loop */      while(1){         if(FreqSweep&lt;=30){             retrvalue=osMessageGet(ADCstateHandle, osWaitForever);             if(retrvalue.value==1){                 FreqSweepConverter=1000/FreqSweep+1;                 htim4.Instance-&gt;PSC=FreqSweepConverter;                 FreqSweep++;             }             if(FreqSweep==31){                 osThreadTerminate(AccuatorHandle);             }         }     } } /* USER CODE END StartAccuatting */ </pre> <p>Old Code:</p> <pre> /* USER CODE END Reader_StartAccuatting */ void StartAccuatting(void const * argument) {     /* USER CODE BEGIN StartAccuatting */      //-----Frequency Sweeping function-----     HAL_TIM_PWM_Start( &amp;htim4, TIM_CHANNEL_1 );     HAL_TIM_OC_Start(&amp;htim4, TIM_CHANNEL_1);     htim4.Instance-&gt;ARR=720000;     htim4.Instance-&gt;CCR1=htim4.Instance-&gt;ARR * 0.50;      /* Infinite loop */     for(FreqSweep=5; FreqSweep&lt;=30; FreqSweep++){         FreqSweepConverter=1000/FreqSweep +1;         htim4.Instance-&gt;PSC=FreqSweepConverter;         pres=htim4.Instance-&gt;PSC;         osDelay(2000);     }     if(FreqSweep==31){         osThreadTerminate(AccuatorHandle);     } } /* USER CODE END StartAccuatting */ </pre> <p>Temperature control logic:  PFO(EN_HP) gpio_out  PC3adc value of temp sensor in reality) <b>jumper from PF6(in design) to PC3.</b></p>	

**Temperature control function:**

```
void TemperatureControl(void const * argument)
{
    /* USER CODE BEGIN TemperatureControl */

    /* Infinite loop */
    for(;;)
    {
        HAL_ADC_Start(&hadc1);
        // Poll ADC1 Perihperal & TimeOut = 1mSec
        HAL_ADC_PollForConversion(&hadc1, 1);
        Temp_Vdigital=HAL_ADC_GetValue(&hadc1);

        Temp_Vanalogue=(float)Temp_Vdigital*3/4096;
        Temp=(Temp_Vanalogue-0.5)/0.01;

        if(Temp<=35){
            HAL_GPIO_WritePin(GPIOF, GPIO_PIN_0, GPIO_PIN_SET);
        }
        else
            HAL_GPIO_WritePin(GPIOF, GPIO_PIN_0, GPIO_PIN_RESET);
        osDelay(500);
    }
    /* USER CODE END TemperatureControl */
}
```

Use ADC polling method, **read single value per 500ms** (save memory& remember to enable ADC continuous conversion model) to enable heating mat on and off.

Timer:</b></p> <p>- Timer 1: Internal Clock</p>  <p>- Timer 3: ADC sampling frequency</p> 

### - Timer 4: Frequency sweeping function

### -Timer 6: System clock

## 2. ADC:

-ADC3\_IN4: Temperature Sensor

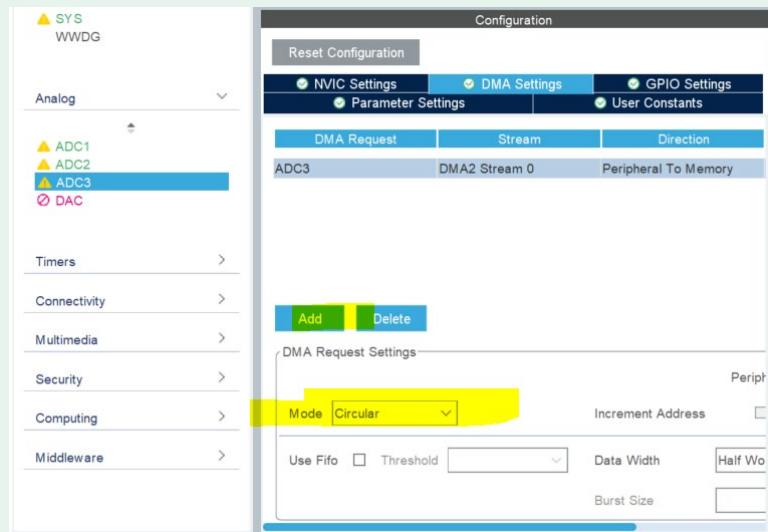

-ADC2\_IN13: Flowrate sensor

-ADC1\_IN11: Pressure sensor PC1

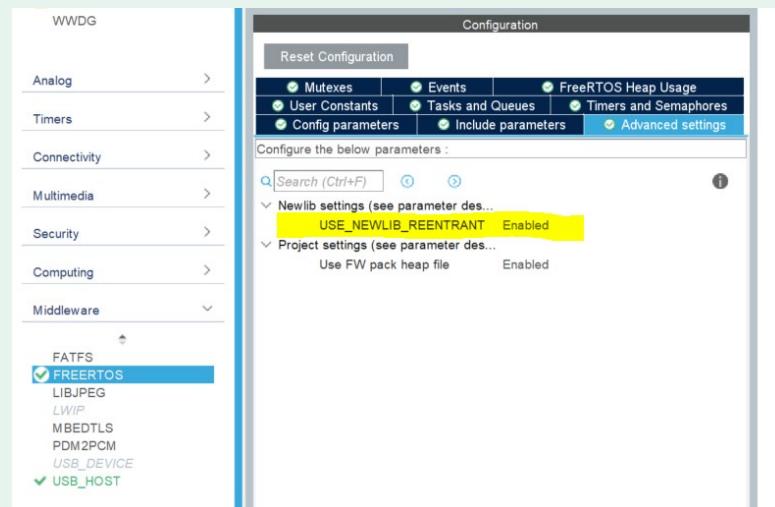

Sampling frequency: 2.048KHz Triggered by timer 3

### 3. DMA setting:

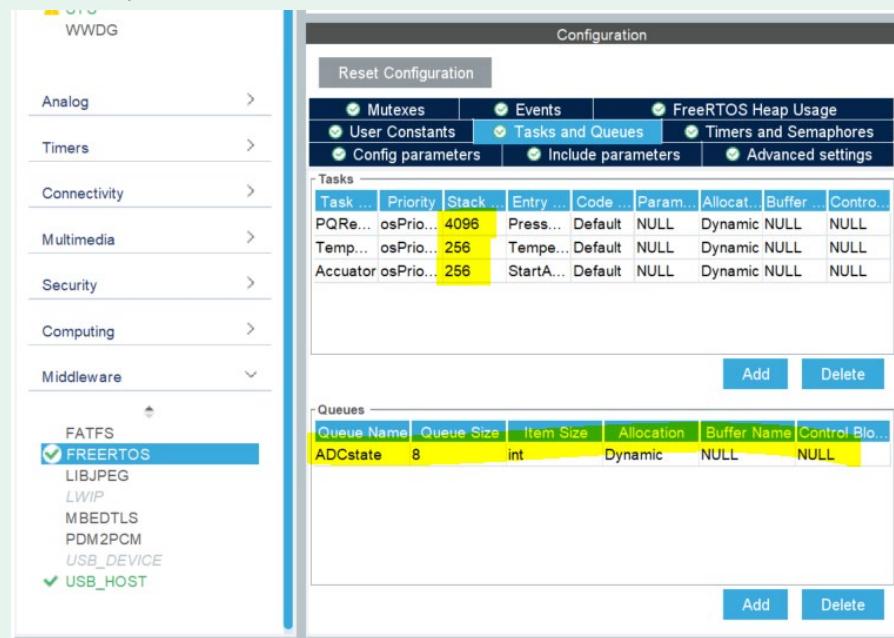

Circular (inside of ADC [2&3] setting)

### 4. FreeRTOS Setting:

Task and queue:

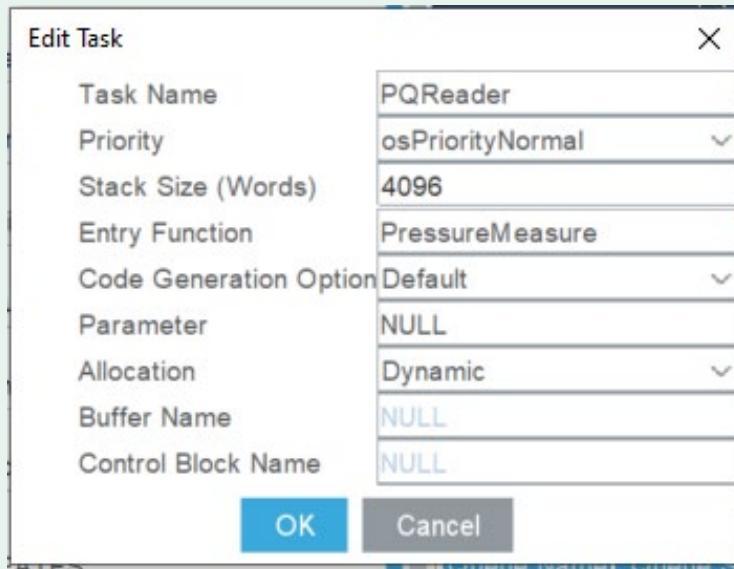

Be careful of stack size & priority(ALL same)

**ERROR: Undefined reference to osMessageGet/Put from cmsis\_os.h**

Opposite from answer but after change to OsMessageQueueGet, works functionally.  
OsMessageGet/Put for CMSIS.V2  
OsMessageQueueGet/Put for CMSIS.V1.

Task configuration example:

FreeRTOS Interface: CMSIS\_V1

**5. FFT computation function**

- include arm\_math.h related files and **path**.
- Include DSP library.

**6. Temperature control function**

**Problem:**

It is shamethat PIN out of PCB cannot be directly fed into MCU board after using TouchGFX to map out its memory(ie: Use LTDC FMC – SDRAM external memory method and pinout cannot be customised)

As pins are limited after using 20+ pins under this method, I couldn't find extra pin to match PCB layout. External jumper and modification on connectors may be required. (Or fabricate another board...)

Lets do the PCB test first.

Heating	Read Temperature sensor – ADC conversion Temperature control logic	Done Done															
UI	Touchscreen manipulation Display graph on touch screen Save data through USB	Done Done Testing															

- Print Electronics case.
  - Print pneumotachometer connector.
- (Any spare time, before Friday)

Done:

### 1. Sensor conversion

Pressure sensor: PA

$$500\text{Pa} \quad DP = \text{sign}\left(\frac{AO_{out}}{VDD} - 0.5\right) \cdot \left(\frac{AO_{out}}{VDD \cdot 0.4} - 1.25\right)^2 \cdot 525$$

Flow rate:

MLT300L, assume it is linear between +300L/min, Calibrated point is (10mmH2O->125L/min)

According to:

Get final conversion calculated by equations:

```
fftin_buf_p[n]=((float32_t)adc_buf_p[n]*3/4096/3.3-0.5)*pow(((float32_t)adc_buf_p[n]*3/4096/1.32-1.25),2)*525; // Pressure sensor conversion
fftin_buf_q[n]=((float32_t)adc_buf_q[n]*3/4096/3.3-0.5)*pow(((float32_t)adc_buf_p[n]*3/4096/1.32-1.25),2)*525)*2.083/98.066; // Flow rate conv
```

Unit:

P: **Pa** (Kpa expression is limited due to the resolution of TouchGFX)

Q: **L/s**

2. USB-OTG-FS needs extra PHY(ic), use USB to transfer data isn't reliable, searching for more approaches (ie: TTL-USB converter?)  
Use BLE module still (HC-05[UR communication]+ STM32)

[HC05 BLUETOOTH MODULE WITH STM32 - YouTube](#)

Sprint: convert float to string then send out by UART(only read ASCII, otherwise data will be binary).

<b>EVENT</b> <input type="checkbox"/> <i>Reading materials</i> <input type="checkbox"/> <i>Laboratory</i> <input checked="" type="checkbox"/> <i>Design</i> <input type="checkbox"/> <i>Others (Device test)</i>	<p>Test:</p> <ul style="list-style-type: none"> <li>- <b>Git Set up</b></li> </ul> <p>Git is super useful when comes to a coding system of the complex system design(STM32CUBEIDE in this case), I was very stressful to back up STM32 files every time after I did updates. Sometimes it could easily get crushed with <b>copy folder</b>. For example, a common error, indicating "make file cannot find target", may be caused by just simply <u>renaming the copy folder</u>.</p> <p>To improve efficiency and ease my mental stress, learning how to use git as the tool to back every changes saved my life. It is also encouraged for every EEE student working on control system design to use this "CS" tool when there's heavy work required for coding and debugging.</p> <p>Useful tutorial:</p> <p><a href="#">Git, GitHub, &amp; GitHub Desktop for beginners - YouTube</a>  <a href="#">Learn Git In 15 Minutes - YouTube</a>  <a href="#">How to upload files/folders/projects on github   Upload Project folder on github (Simple Way) - YouTube</a></p> <p>The simplest procedure from my own experience:</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="text-align: left; padding: 2px;">Tool</th> <th style="text-align: left; padding: 2px;">Git+ GitHub</th> </tr> </thead> <tbody> <tr> <td style="padding: 2px;">Procedure</td> <td style="padding: 2px;"> <ul style="list-style-type: none"> <li>- Download both of them</li> <li>- Open working folder with Git Bash</li> <li>- Type "git init", create a repository under this path</li> <li>- Open GitHub, file-&gt;Add a local repository</li> <li>- Done</li> </ul> </td> </tr> </tbody> </table> <p>Test plan:</p> <p>See:</p> <p><a href="https://uoemy.sharepoint.com/personal/s2134810_ed_ac_uk/Documents/learn/MEng/Phase2/Result/TestData.xlsx">https://uoemy.sharepoint.com/personal/s2134810_ed_ac_uk/Documents/learn/MEng/Phase2/Result/TestData.xlsx</a></p> <p>TODO:</p> <ul style="list-style-type: none"> <li>- Test Sensing function, collect data from ADC(download from work space?)</li> <li>- Populate temperature sensing PCB, verify the input of temperature sensors.</li> </ul>	Tool	Git+ GitHub	Procedure	<ul style="list-style-type: none"> <li>- Download both of them</li> <li>- Open working folder with Git Bash</li> <li>- Type "git init", create a repository under this path</li> <li>- Open GitHub, file-&gt;Add a local repository</li> <li>- Done</li> </ul>
Tool	Git+ GitHub				
Procedure	<ul style="list-style-type: none"> <li>- Download both of them</li> <li>- Open working folder with Git Bash</li> <li>- Type "git init", create a repository under this path</li> <li>- Open GitHub, file-&gt;Add a local repository</li> <li>- Done</li> </ul>				

Sensing test:

Board works functionally, Original design is inappropriate.

Problem:

**Negative voltage output from sensors.**

Offset voltage of pressure sensors are around 1.6V, DC part is removed after the bandpass filter, therefore, as this sensor is bi-direction, negative value possibly could be attained. However, STM32F4 series controller can only support positive input of ADCs. I ignored transit issue before and only cared about AC analysis.

In fact, **bandpass filter is unnecessary** as only high frequency inside of the device could only generate by LSA. Therefore, modified original circuit to a **LPF**(Low pass filter to remove tidal breath(Normally 0.5-2Hz)) + **VD**(Voltage divider, add a  $3.3/2=1.65V$  offset in the end. )

Schematic and simulation result can be found through Phase2->LabData->SensingData

As new PCB have been printed out 😞 **Manual correction on new board** needs to be done on this part. (Not really, got a new design from Alan, still waiting for parts, new board will be populated at next semester)

More reliable PCB manufacture is required.
Problem	Solution				
When restart and power the actuator, an overshoot will power LSA initially at 12V.	It really depends on PCB and switch circuit. As my PCB is <b>bare board design</b> , all tracks are exposed outside, therefore, overshoot happens occasionally. More reliable PCB manufacture is required.				

Data Request from:

1. Tidal breath Measurement  
No need to use MCU, set up sensors on Bread board(Without filter) & PCB(With filter/adjust capacitor firstly), measure tidal breath with oscilloscope. (All parts can be sealed after this.)  
Without AC;  
Without/With Bandpass filter (Y: Pressure / G:FlowRate)

**Beautiful graph!! Exactly consistent with [previous study](#) :**

***P and Q In Phase.***

2. Actuating signal (in tube) Measurement

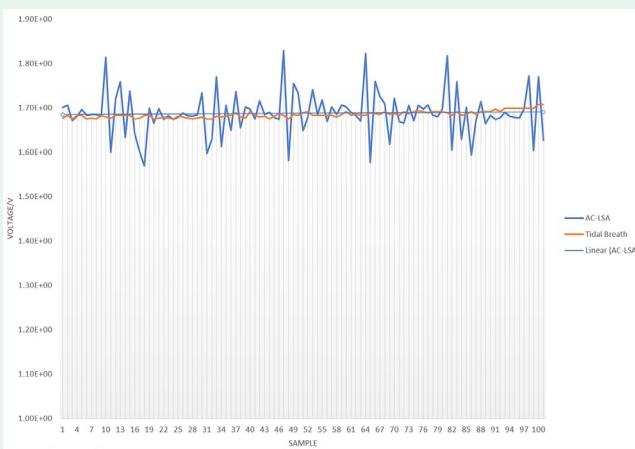

Done. See file: Phase2->Result-> TestData->Test1-AC+Sensors

Zoom in, pick a length of signal:</p>  <p>It is not a small amplitude signal compared to the tidal breath of human. Available approaches:</p>

- Thicken the membrane;
  - expand stoke length of LSA
2. Test 4:  
Measure respiratory impedance with temperature control
3. Test 5:  
Measure respiratory impedance under temperature control

**Emergent situation:**

**One of sensors got burnt**

Issue	Suspect cause	Conclusion & Solution
One of sensors got burnt	Mechanical damage: Pressure out of range	I did a few tests, thought electrical spike might be the main issue in this case. As I frequently switched on/off 12v power supply, and this PCB is almost bare board due to the limitation of PCB manufacture by ourselves. Lots of spikes were detected during my other tests. The supply current of this type of sensor is 3.3-5.8mA, I added a large resistor at the end of sensor output, restricting large current flowing through this, which will probably be helpful(Hopefully) . Do not long-time power whole system with 12V.
	<b>Electrical damage: Power supply spikes in circuit</b>	<b>Solution:</b> <b>Add a large load resistors.</b> <b>Order two new sensors.</b>

Delete 12V pour layer, <u>Ground pour was occasionally deleted</u> (due to a manufacture issue.)</li> </ol>												
3	-Same features as previous version	<ol style="list-style-type: none"> <li>1. Changed <b>3V3 regulator and its peripheral circuit</b>. (Current limit for previous regulator is 200mA, however, 250 mA is sinking from MCU and 10mA is sinking from sensors. Therefore, change a new 3V3 regulator with current limit up to 500mA)</li> <li>2. Add <b>vias</b> for through whole connector. (Due to manufacture limit in the Uni, all vias and through whole components have to be manually soldered on both sides)</li> </ol>												

		<p>sides, which means through whole connectors were taken apart firstly and assemble back, causing noises and instability.)</p> <p>3. Add <b>ground pour</b> layer back.(Manufacture )</p> <p>4. Change band pass filter to high pass filter + voltage divider(avoid negative value input to the ADC)</p>
--	--	---

#### Temperature sensing board: 2 Version

Version No.	Feature	Modification
1	<ul style="list-style-type: none"> <li>-Temperature sensor field.</li> <li>-Low pass filter for temperature sensor output.</li> <li>-Connectors for power input and analogue output.</li> </ul>	None
2	Same features as previous	<ul style="list-style-type: none"> <li>1. Correct layer orientation.</li> <li>2. Correct connector length.(2mm to 2.54mm)</li> </ul>

#### Mechanical Output- Mechanism of the device

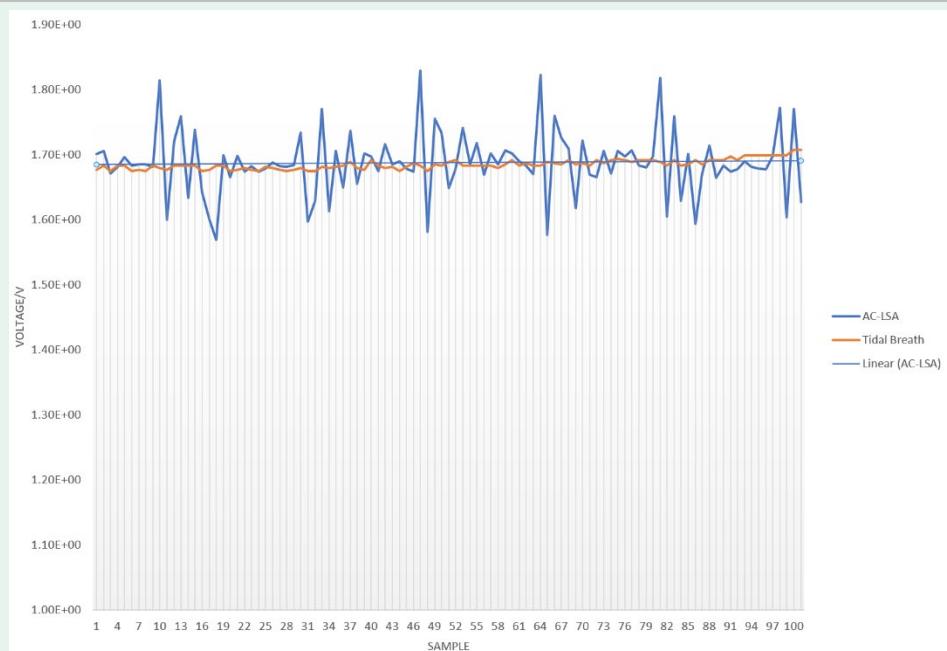

Version NO.	Feature	Modification
1	<ul style="list-style-type: none"> <li>-Part 1: LSA studio</li> <li>-Part 2: Membrane connector(Connect Membrane+ Air outlet)</li> <li>-Part 3: Sensor connector (Connect pressure sensor and temperature sensor board)</li> </ul>	<p>Cut the edge of junction to fit in the mouthpiece.</p> <p><b>0.2-0.4mm for strong squeezing connection</b></p>
2	-Same features as previous	<p>Part 1:</p> <p>1.Opened top roof, providing more space for cable settlement.</p> <p>Reduced stoke length for LSA(12cm? to 14.3cm)</p> <p>2.Changed the diameter of Membrane junction (Improvement: membrane flange/google it</p>

Result:

Tidal breathing:

Actuating signal:

**Discussion** can be added here: **How small the actuating signal can be?**

Previous student COMCOUL model define the amplitude of actuating signal as 0.3kPa(Convert to voltage). From my experiment, this actuating signal generated by LSA is far bigger than tidal breathing, but what should the relationship be between them?

Talked about solutions to reduce amplitude of this actuating signal.

#### **Another discussion: Why sensors got burnt.**

Check daybook on 29,Nov

## -Sensing Test:

Simulation:

- Changed original **bandpass filter** to a **high pass filter + voltage divider**(Remove tidal breath ~0.2-0.5Hz)

New PCB was not tested.(3v3 regulator hasn't been delivered)

## -Actuating Test

Used oscilloscope to record how actuating signal look like

**Can do- But :**

Large amplitude/ High harmonics

**Improvement:**

How to reduce amplitude?

How to reduce harmonics?

(Membrane setting: Thickness of membrane/ Mechanism of membrane set up(tension))

## Tidal breathing:

- Without AC, Without Filter
- Without AC, With Bandpass filter
- Without AC, With HPF+ Voltage divider - > **New PCB Test**
- With AC, With HPF+ Voltage divider -> **Final impedance Measurement**

## Temperature control

- Record analogue reading from workspace
- Recorded digital output of TS control
- Aligned two of them, got reliable response.

Improvement:

**Multistage control**, set another TS board on heating mat, protecting mechanism surrounded from melting.

PID controller application further test

Dimension:

WHL:

W=90mm

H=100mm

L=279mm
